

Alarm Systems

ALARM SYSTEMS

We install, service and monitor commercial and residential alarm systems, including signals for:

- burglar
- fire
- panic
- hold-up
- temperature

We will design and install a state-of-the-art security system, customized to serve the needs of your family, or business. Only high quality equipment, that has proven to be reliable and user friendly, is used. Our Service and Installation Department stands behind all work and our skilled technicians will install your system right.

We can even take over the monitoring of your existing system by simply re-programming the alarm control panel you already have. We have an extensive network of technicians and can provide alarm service throughout the Western States.

In addition to providing alarm service and monitoring to homes, we specialize in providing electronic security services for businesses. Our client list includes several "chain" stores. One of the benefits of subscribing to Atlas Security is that you will have one account manager who is familiar with your account and will take care of all your security needs, there is no being transferred from person to person.

We can also install overt, or covert, closed circuit television systems (CCTV) to allow for visual monitoring of your facility. We can also give you internet access to the system for remote viewing of live and recorded images.

Our Underwriter's Laboratory listed central station is staffed with highly competent personnel, and fully computerized, for efficient handling of all alarm signals.

Armed response to your alarm signal, by an Atlas Security patrol officer, is available in the Los Angeles area. This will allow for the fastest response time available. Also, by having our patrol officer investigate an alarm activation, the police department will only be called in the event they are needed, reducing the burden on them and saving you from the false alarm fees imposed by local authorities.
